

Healthy gut microbiota and natural variability, stability and resilience – Identification of microbiota covariates and life style effects

Prof. Jeroen Raes

Department of Microbiology and Immunology

Rega Institute, KU Leuven

VIB Center for the Biology of Disease

jeroen.raes@med.kuleuven.be

KU LEUVEN

The discovery phase: microbiome association studies open up the promise for novel diagnostics and treatments

Reality check:

We don't even know what a *healthy* flora means!

Microbiome state-of-the-art:

MetaHIT, HMP + specific lab studies
combined have profiled ± 2000 individuals
world-wide, still biased cut of the
population

Genetics: 10-100.000s
individuals

Variation in clinically relevant population = largely unknown

Temporal variation & stability of biomarkers = largely unknown

Factors influencing gut flora composition = largely unknown

Effect of host genetics = largely unknown

Effect environment = largely unknown

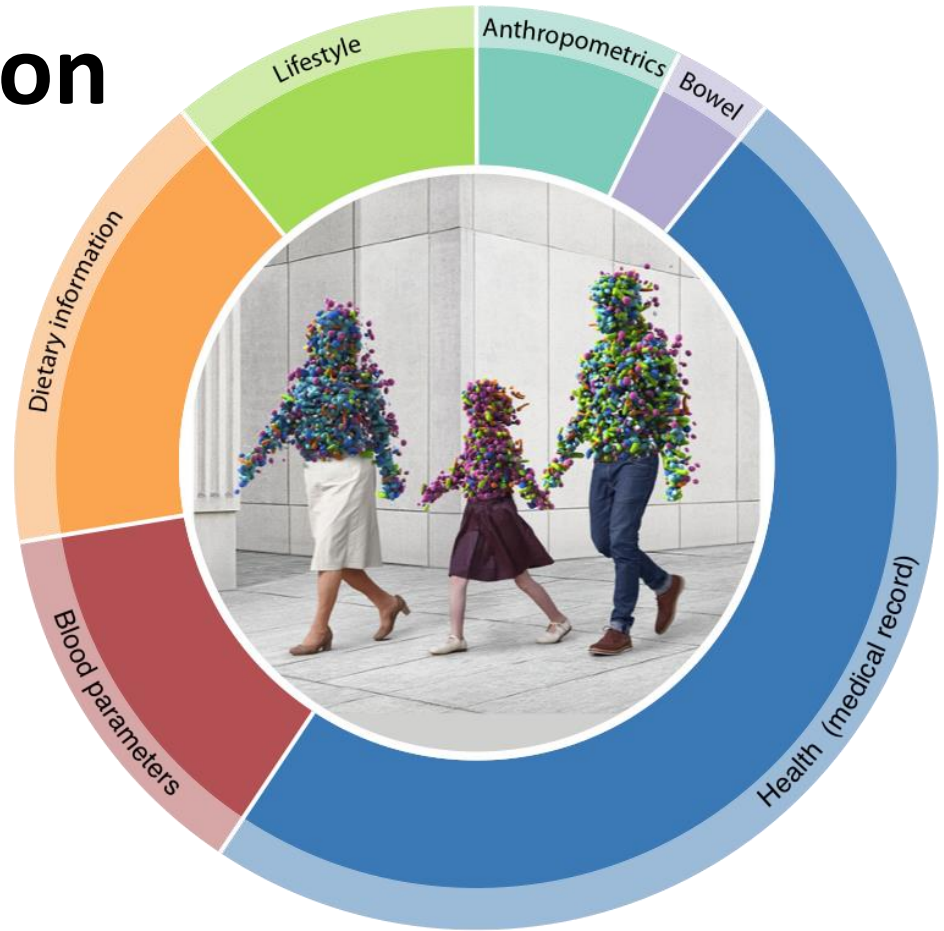

Clinical end points for functional foods, pre-/pro/synbiotics,
pharma-/nutriceutical interventions etc are *unknown*

Flemish gut flora project: longitudinal study of +/-5000 volunteers spread over a confined geographic region

FGFP sample collection

- Collection of faecal, blood (GP) and saliva samples
- Questionnaires:
 - Self-reported health
 - Detailed health (GP)
 - Diet (incl probiotics, drugs)
 - Wellbeing/QoL
 - Hygiene
 - Bowel habit/Bristol scale
 - Travel, Stress etc
- Blood analysis: metabolic (e.g. glucose, HDL/LDL, triglycerides, insulin,...) and immunological/inflammatory readouts (cell counts, interleukins, CRP,...)
- Secured database, patient encoding

Dit kaartje heeft 6 velden in de bovenste rij en 6 velden onderaan. Het kaartje wordt bij de hand genomen bij de steekproef (ongegidert) en wordt (na de toel.) in de steekproef uitgesloten met een veld (Steekproefuitgesloten).

Naam: _____
 Voornamen: _____
 Dierlijke studieruimte: _____
 Tijdstip steekproef: _____

Vervolg uitwerking:
 ☐ Minder dan 4 uur geleden
☐ Tussen 4 en 12 uur geleden
☐ Tussen 12 en 18 uur geleden
☐ Tussen 18 en 24 uur geleden
☐ Tussen 24 en 36 uur geleden
☐ Tussen 36 en 48 uur geleden
☐ Langer dan 48 uur geleden

Omschrijf per steekproefveld: 1 2 3 4 5 6 7

Current status:
3400 sample sets collected

Cross-national collaboration to study population-level variation of the gut microbiota

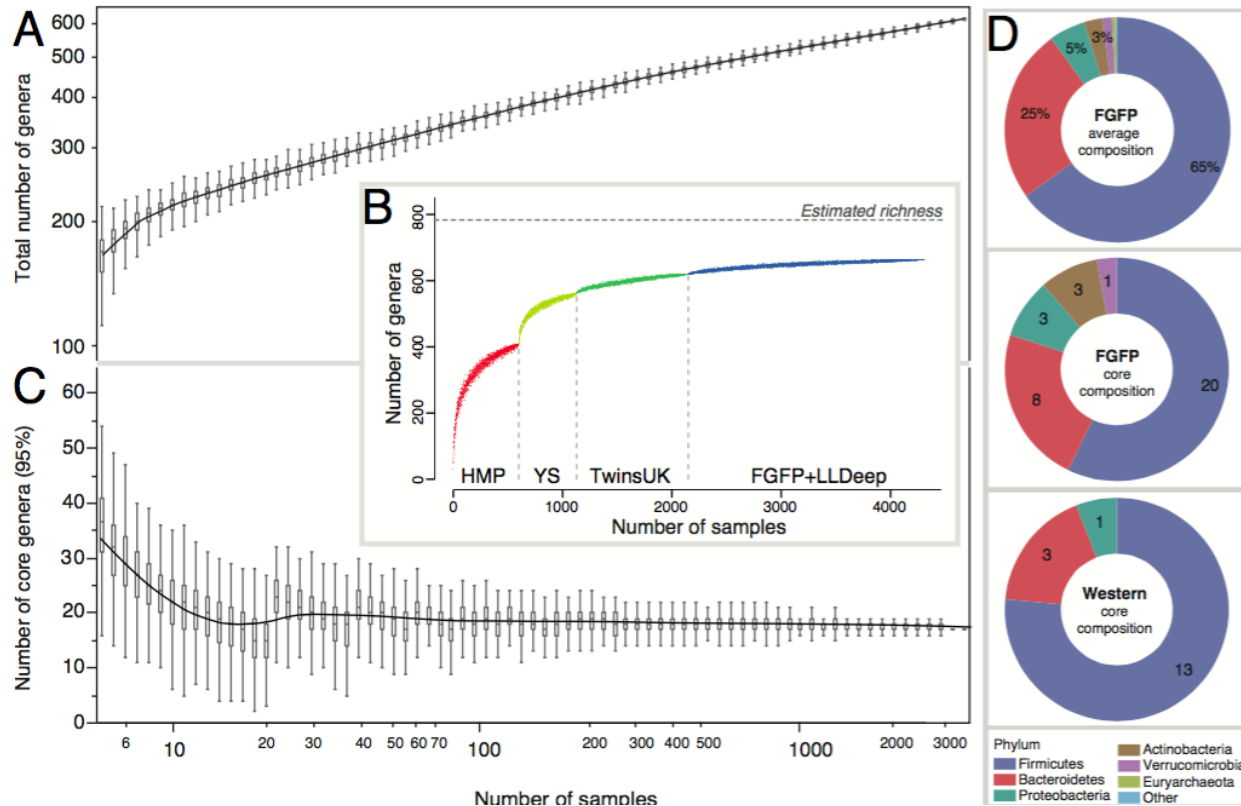

Discovery cohort: FGFP first data freeze (N=1106)

Replication cohort: Lifelines Deep (Groningen, NL; N=1135)

Falony*, Joossens*, Vieira-Silva*, Wang* et al., **Science** 2016
Zhernakova et al., **Science** 2016

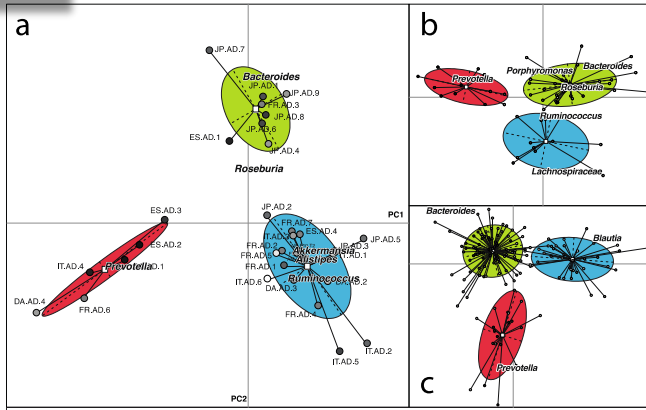

Integration with global datasets (N=3,948) reveals stable core microbiota, yet total gut diversity is still underexplored

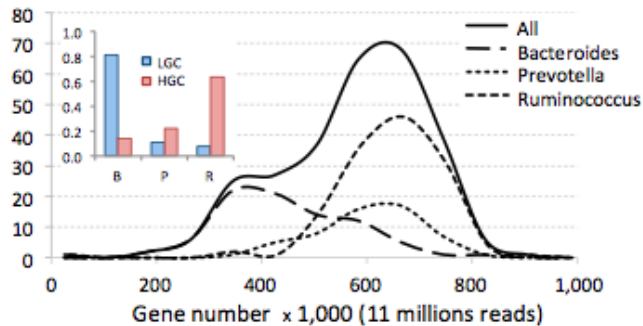

Western core =
17 genera;
incl remote
populations: 14

Est. 40,000 individuals will need to be profiled to reach saturation

Enterotypes: from 'blood groups' to density landscapes

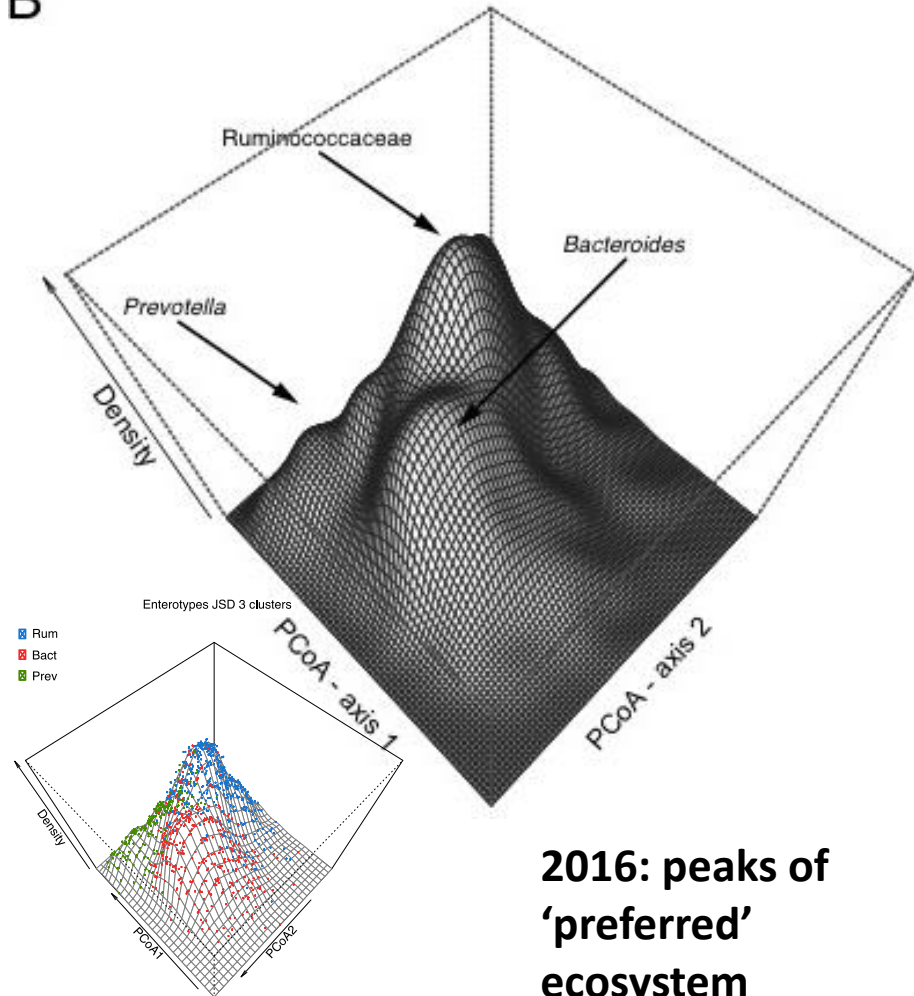

Arumugam*, Raes* et al. Nature 2011

Enterotype association to metabolic syndrome risk markers; Le Chatelier et al Nature 2012

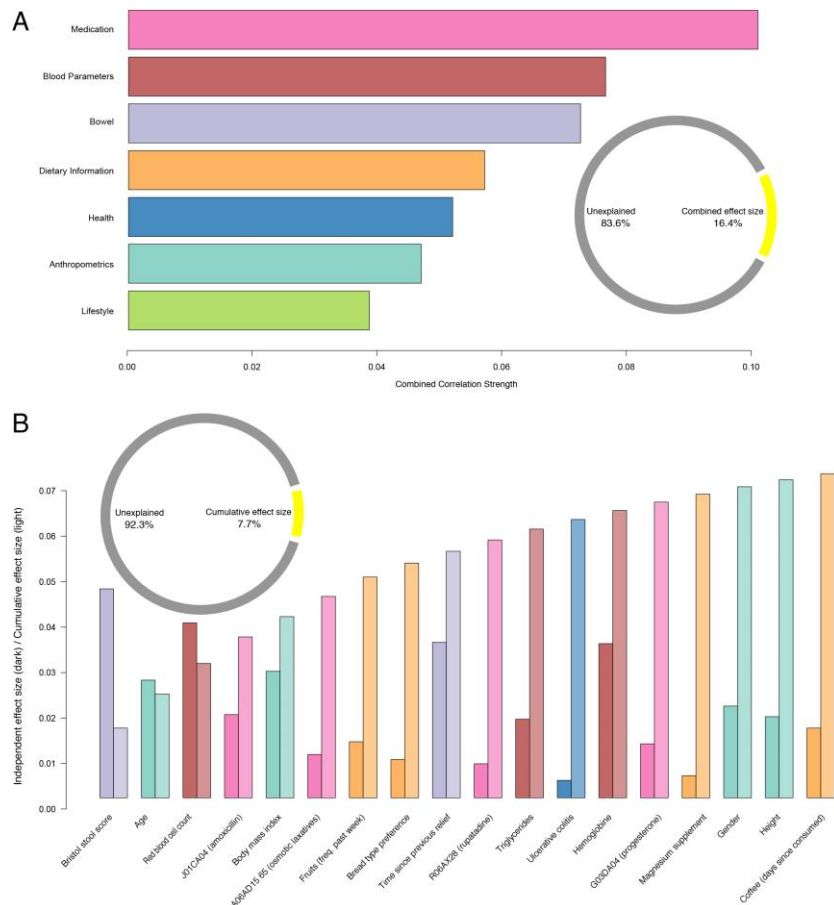

B

Falony et al. Science, 2016

2016: peaks of 'preferred' ecosystem constellations

Identification of 69 factors associated with microbiota variation

92% of comparable factors replicate in LLDeep

Identification of multiple dietary covariates

Dietary interventions as potential microbiota modulation strategy

Fruit consumption
Meat consumption
Bread type preference
Soy products/yoghurts

Go Belgium!

Beer consumption
Dark chocolate preference

Microbiota-drug associations as primary confounder category

A

		Medication type									
		β-lactam antibiotic J01CA04	β-lactam antibiotic J01CR02	Anti-histamine R06AX28	TNF alpha inhibitors L04AB	Progesterone G03DA04	Osmotic laxatives A06AD15-65	Mesalazine (IBD-treatment) A07EC02	Immunosuppressant L04AX01	Estrogens G03CA04-CC06	Contraceptive hormones G03AA12
Matched case-control	Community composition changes										
	Observed richness decreases										
	Pielou evenness decreases										
	Fisher diversity decreases										
	Higher proportion of core genera										
	Abundance differences*										
MaAsLin	Abundance differences*										

Direct associations

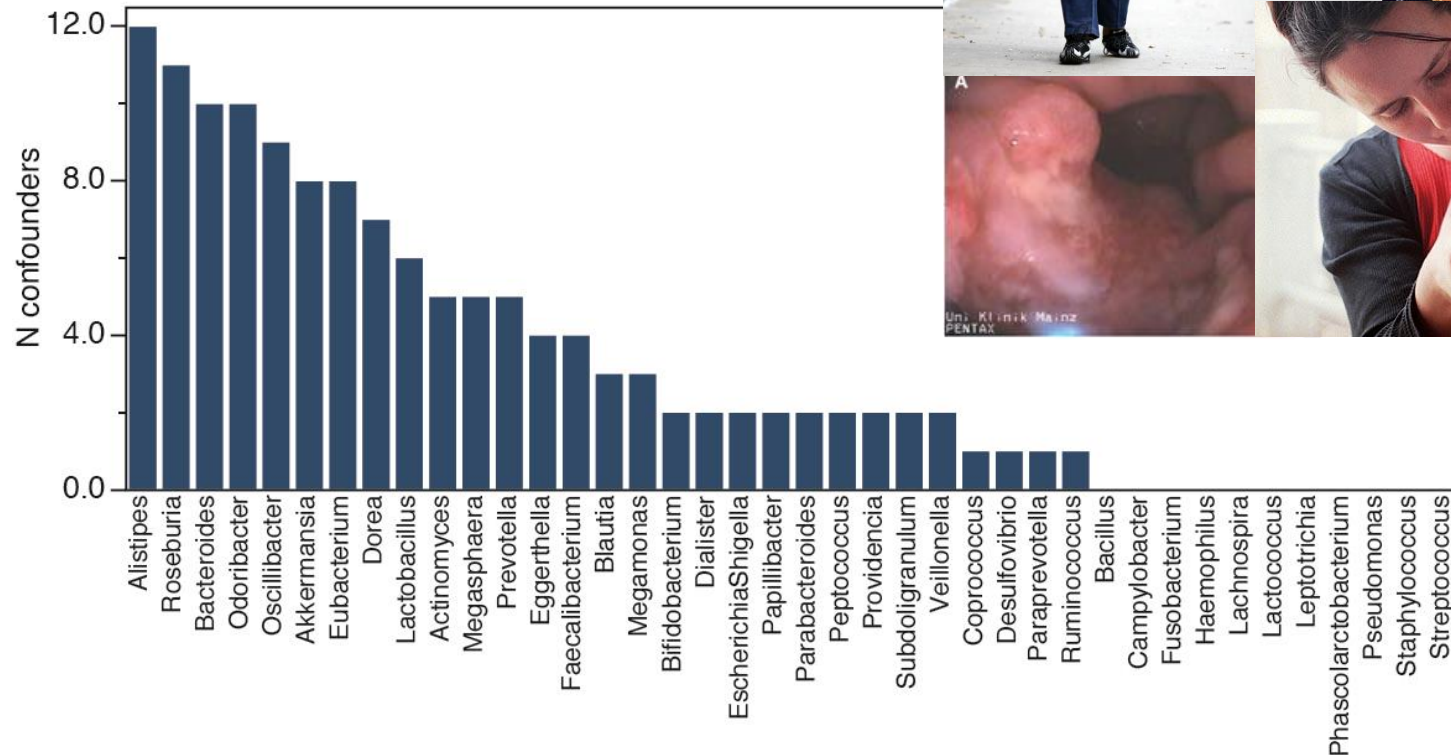

e.g. Antibiotics, laxatives,
Immunosuppressants, Hormones

B

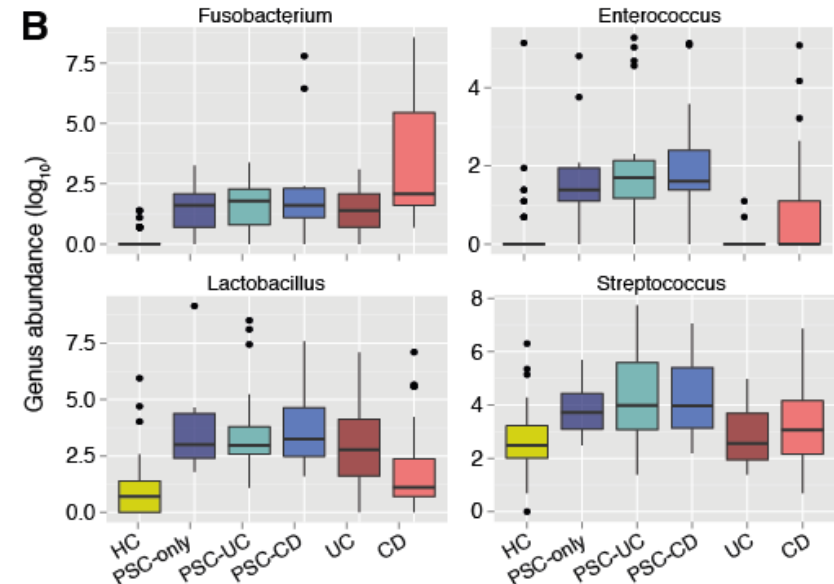

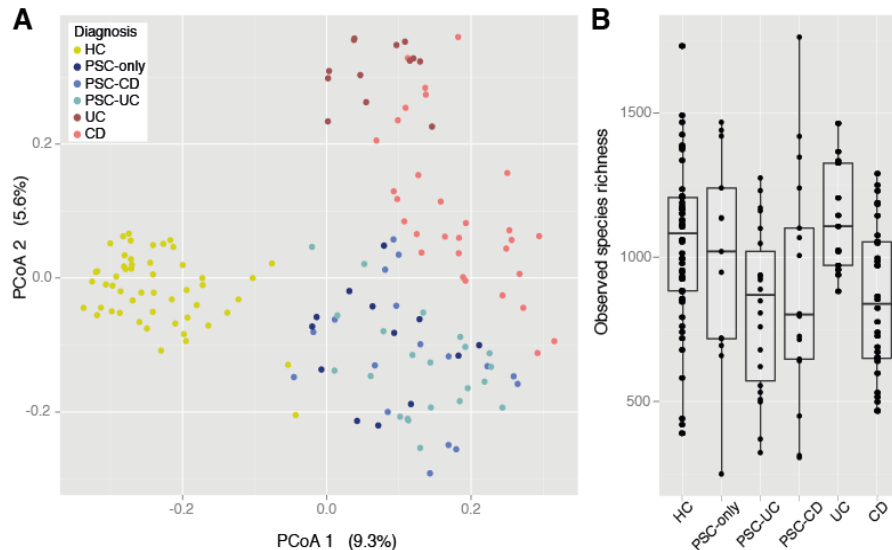

Drugs interacting with cofactor-associations

Majority of genera thusfar associated to disease are also confounded by unrelated host factors

Using matched FGFP controls & confounder knowledge increases robustness of clinical microbiome studies

Identification of Primary Sclerosing Cholangitis (PSC) signature independent from IBD and drug usage

FGFP: next steps

Longitudinal sampling

- Whole cohort sampled every 2 years
- 500 participants sampled every month for 24 months
- 50 participants sampled every week for 24 weeks
- 50 participants sampled every day for 45 days

Data generation:

- From 16S sequencing to metagenomic shotgun sequencing → phylogenetic & functional profiling
- Host genotyping
- Metatranscriptomics, proteomics, metabolomics
- Target strain culture and characterization

The healthy microbiota as a drug: Faecal bacteriotherapy in Ulcerative Colitis

FMT in UC: 25% success rate

Microbiome monitoring allows treatment optimisation

“Donor” biodiversity determines treatment outcome

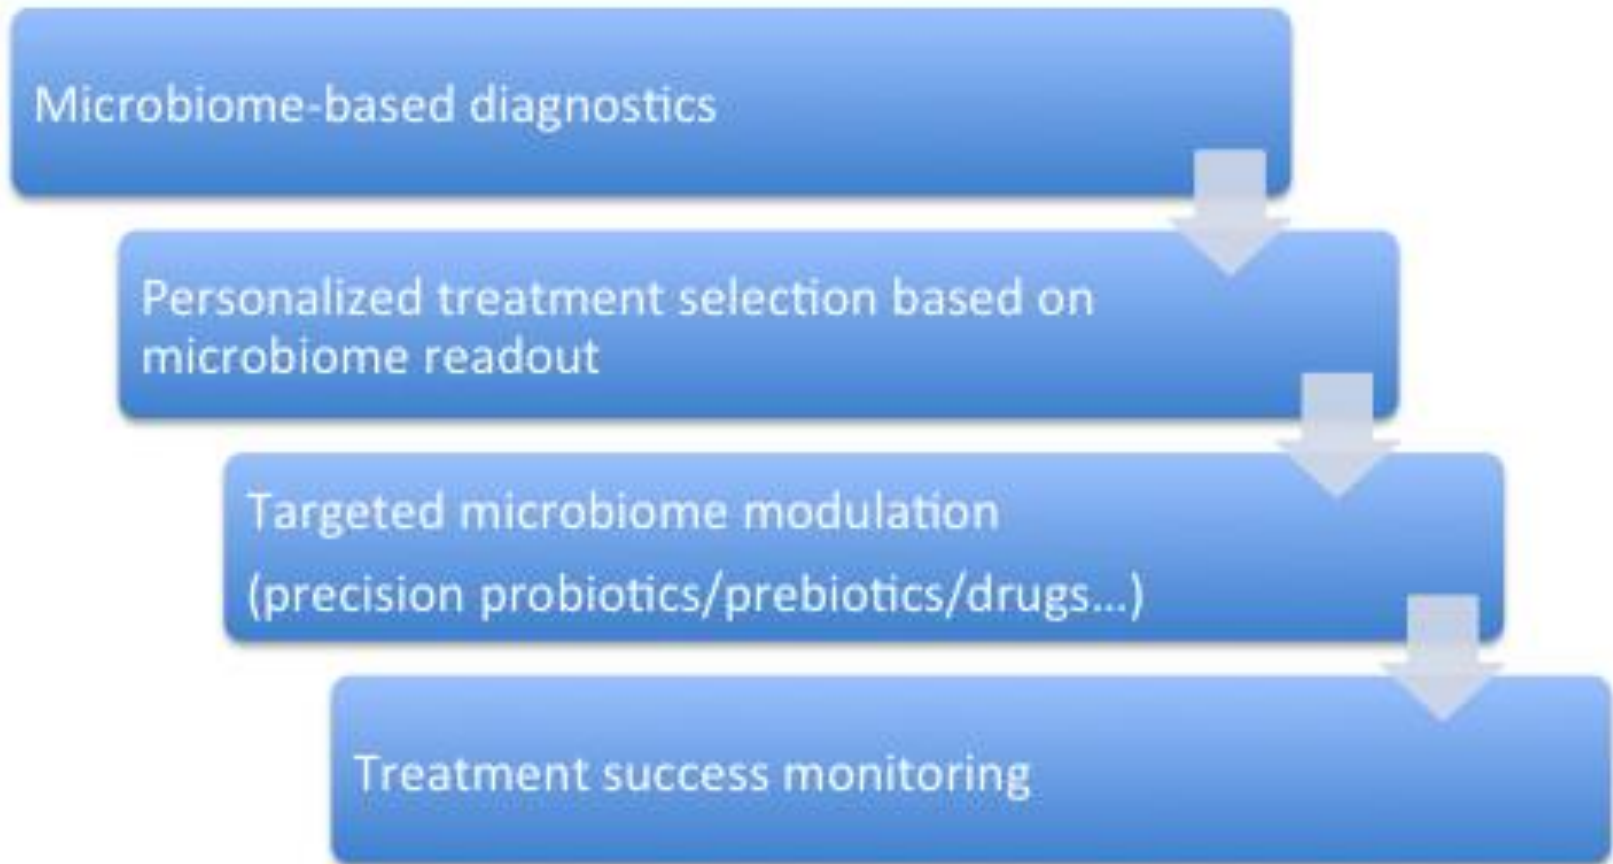

Patient microbiome predictors for treatment success

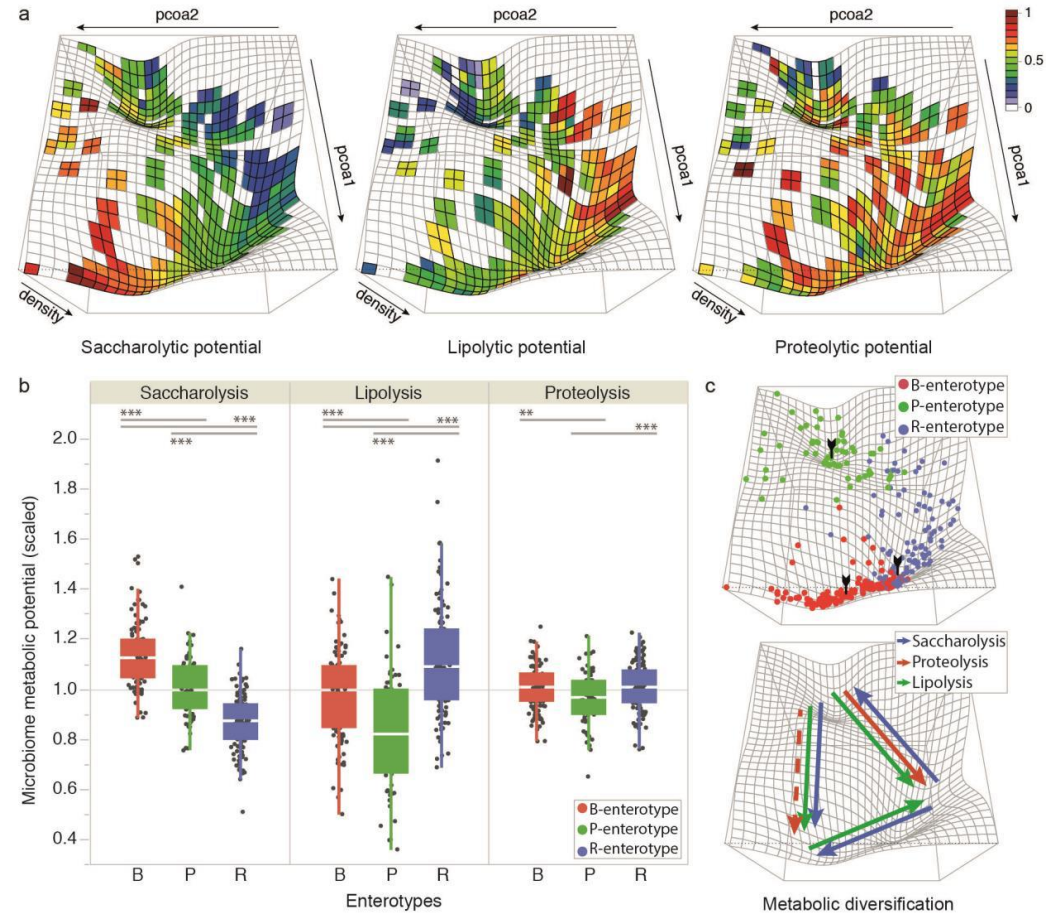

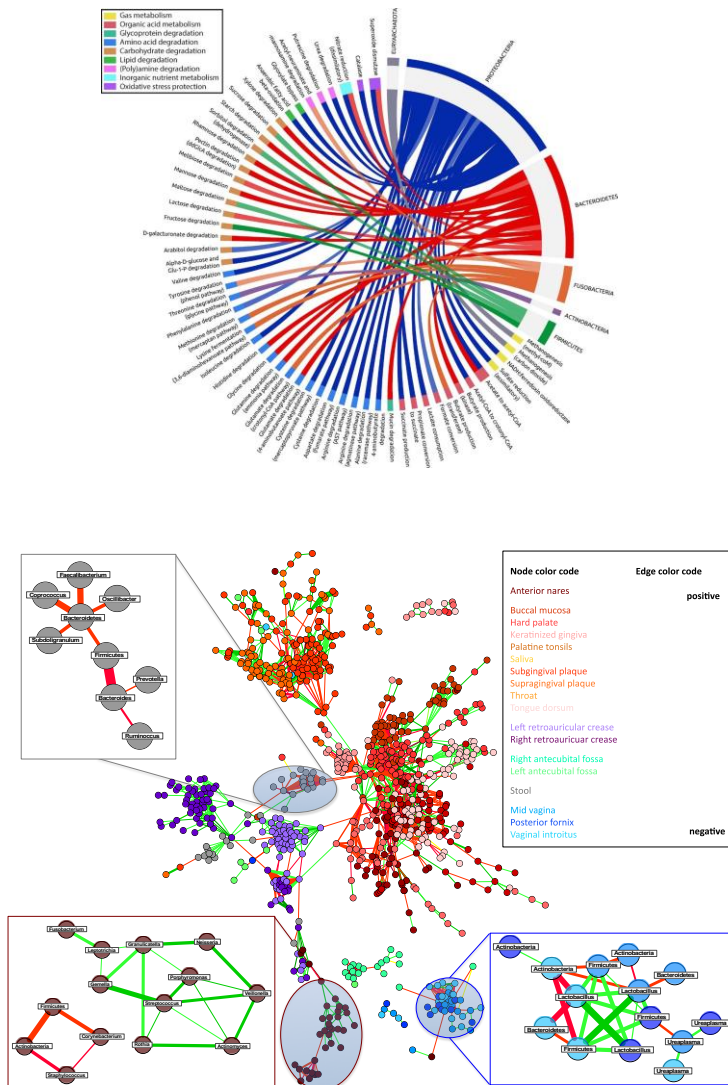

Development of next-gen probiotic cocktails

Microbiome therapeutic model

From parts lists to system-level understanding

“who-does-what” map of the intestinal ecosystem
indicates lowered perturbation resilience in the Bacteroides enterotype

Vieira-Silva*, Falony* et al *Nature Microbiology* in press

HMP, Nature 2012

Conclusions

- Definition of normal variation and confounders is essential towards robust microbiome diagnostics and preventive care
- Microbiome as drug and/or treatment guidance
- Systems approaches provide insights in biology behind dysbiotic states
- Multi-national collaboration essential for generalization and validation of results
- Ongoing: long-term variation and health outcomes

Policy suggestions

- Structural, long-term funding of national microbiome initiatives essential for survival
- Establishment of international integration mechanisms between cohorts: towards a global microbiome monitoring effort (incl. remote populations!)
- Human intervention studies are the ultimate proof: tight integration between microbiome data crunchers and clinical groups
- Public-private partnerships crucial for translation of findings to products
